-! CATALYTIC ACTIVITY: Anthranilate + phosphoribosylpyrophosphate = longhoribosyl-anthranilate + diphosphate.

-! PATHWAY: Tryptophan biosynthesis, second step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Submitted (JUL-1997) to the BMBL/GenBank/DBBJ databases.
Submitted (JUL-1997) to the BMBL/GenBank/DBBJ databases.

-!- FINCTION: Wost upstream protease of the activation cascade of caspases responsible for the TNFRSF6/FAS mediated and TNFRSF1A induced cell death. Binding to the adapter molecule FADD recruits it to either receptor. The resulting aggregate called death-inducing signaling complex (DISC) perform CASPB proteolytic activation. The activat downstream apopt tic proteases.

CAPS and CAPP, are likely retained in the DISC. Cleaves and activates CASP3, CASP4, CASP7, CASP9 and CASP10. May participate in the GZMB apoptotic pathways. Cleaves ADPRT.

Hydrolyzes the small-molecule substrate, Ac-Asp-Glu-Val-Asp-1-AMC. Likely target for the compox virus CRWA death inhibitory protein.

CHENYME REGULATION: Inhibited by Z-VMD-FK, CTMB and DISC.

-!- SUBUNIT: Heterodimer of a 18 kDB (P18) and a 10 kDB (P10) subunit.

-!-FUNCTION: Member of the two-component regulatory system phoQ/phoP which regulates the expression of genes involved in virulence and promotes intramacrophage survival of S.typhimurium. Is required to attenuate bacterial growth within fibroblast cells. PhoQ may function as a membrane-associated protein kinase that phosphorylates phoP in response to environmental signals.
-!- SUBCELLUIAR LOCATION: Integral membrane protein. inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            McClelland M., Sanderson K.E., Spieth J., lifton S.W., Latreille P., Courtney L., Porwollik S., Ali J., Dante M. -i- PATHWAY: GGT PLAYS A KEY ROLE IN THE GAMMA-GLUTAMYL CYCLE, A PATHWAY FOR THE SYNTHESIS AND DEGRADATION OF GLUTATHIONE.
-i- SUBUNIT: THIS ENZYME CONSISTS OF TWO POLYPEPTIDE CHAINS, WHICH ARE SYNTHESIZED IN PRECURSOR FROM A SINGLE POLYPEPTIDE.
-i- SUBCELLULAR LOCATION: PERIPLASMIC (By similarity).
-i- SIMILARITY: STRONG, TO OTHER GGT ENZYMES AND TO GL-7ACA ACYLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TISSUE=Placenta;

SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: WIDE TISSUE DISTRIBUTION (HIGHEST IN THE
TANCKEAS AND VERY LOW IN BRAIN). CLOSELY ASSOCIATED WITH THE BASAL
LAYER OF CELLS IN EPITHELIA AND THE ENDOTHELIUM OF BLOOD VESSEL
WALLS.
                                                                                                      DEVELOPMENTAL STAGE: IS UNDER DEVELOPMENTAL CONTROL IN LIVER AND MAY ALSO BE REGULATED DURING DIFFERENT ATION IN OTHER TISSUES. UPRECULATED FOLLOWING MALICHART TRANSFRAMATION IN SOME CELL TYPES. POLYMORPHISM: LU IS RESPONSIBLE FOR THE LUTHERAN BLOOD GROUP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GO; GO:0005887; C:Integral to plasma membrane AS.

Submitted (MAR-2001) to the EMBL/GenBank/DDBJ databases.
-:-FUNCTION: Through the carboxylation of phosphoenolpyruvate (PEP)
it forms oxaloacetate, a four-carbon dicarboxylic acid source for
the tricarboxylic acid cycle.
-:-CATALNITY: Phosphate + oxaloacetate = H(2)0 +
phosphoenolpyruvate + CO(2).
-:-PATHWAY: Tricarboxylic acid cycle.
-:-SIMILARITY: BELONGS TO THE PEPCASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-FEB-2003 (Rel. 41, Created)

SIMILARITY: BELONGS TO THE FIREIL-ASSCCIATED COLLAGENS WITH INTERRUPTED HELICES.
SIMILARITY: Contains 4 VWFA domains.
SIMILARITY: Contains 18 fibronectin type III domains.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Conserved hypothetical protein TP0829 - syphilis spirochete
C;Species: Treponema pallidum subsp. pallidum (syphilis spirochete)
C;Date: 24-Jul-1998 #sequence_revision 24-Jul-1998 #text_change 05-Nov-1999
C;Accession: G71276
R;Fraser, C.M.; Norris, S.J.; Weinstock, G.M.; White, O.; Sutton, G.G.; Dodson, R.; Gw; Fraser, C.M.; Norris, S.J.; Weinstock, G.M.; White, O.; Sutton, G.G.; Dodson, R.; Gw; Tson, J.; Khalak, H.; Sinith, H.O.; Venter, J.C.
Science 281, 375-388, 1998
A;Title: Complete genome sequence of Treponema pallidum, the syphilis spirochete.
A;Reference number: A71250; WUID:98332770; PMID:9665876
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Status: preliminary; nucleic acid sequence not shown; translation not shown A;Molecule type: DNA A;Molecule type: DNA A;Residues: 1-294 «COL» A;Residues: 1-294 «COL» A;Coss-references: GB:AE001253; GB:AE000520; NID:g3323133; PIDN:AAC65795.1; PID:g3323: A;Experimental source: strain Nichols

hyborherical protein APELS52 - Aeropyrum pernix (strain X1)
C;Species: Aeropyrum pernix
C;Species: Aeropyrum pernix
C;Species: Aeropyrum pernix
C;Accession: A72637
R;Kawarabayasi, Y.; Hino, Y.; Horikawa, H.; Yamazaki, S.; Haikawa, Y.; Takah awa, H.; Takahaya, M.; Masuda, S.; Funahash, T.; Tanaka, T.; Kudoh, Y.; Yamazaki, J.; K
DNA Res 6, 83-101, 1999
A;Title: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Aeropyr
A;Reference number: A72450; MUID: 99310339; PMID: 1)382966
A;Accession: A72637
